

## Summary

Gundrilling is a special and unique machining service that creates a long, very straight, relatively small diameter hole. The service is applicable to a broad range of materials. We are able to achieve tight tolerances, smooth surface finishes and then easily repeat the process. Typically, this specialized service is not a core competency of a machining organization. MIC Group is pleased to offer in-house gundrilling to our customers to eliminate the extended project lead time associated with outsourcing. This, in turn, saves our customers time and money.

## Specifications

Min Diameter & Max Depth	.093" x 30"
Max Diameter & Max Depth	1.5" x 72"
